

## Kinetics lab sheet.

Equations:

$$\text{rate} = \frac{-\Delta[\text{I}^-]}{2\Delta t} = \frac{-\Delta[\text{H}_2\text{O}_2]}{\Delta t} = \frac{+\Delta[\text{I}_2]}{\Delta t} = k[\text{I}^-]^a[\text{H}_2\text{O}_2]^b[\text{H}^+]^c$$

With the use a buffer, the  $[\text{H}^+]$  is constant. The equation then becomes:

$$\text{rate} = \frac{-\Delta[\text{I}^-]}{2\Delta t} = \frac{-\Delta[\text{H}_2\text{O}_2]}{\Delta t} = \frac{+\Delta[\text{I}_2]}{\Delta t} = k'[\text{I}^-]^a[\text{H}_2\text{O}_2]^b \quad \text{where } k' = k[\text{H}^+]^c$$

Take the ln of each side :  $\text{rate} = k'[\text{I}^-]^a[\text{H}_2\text{O}_2]^b$

$\ln \text{rate} = \ln k' + a \ln [\text{I}^-] + b \ln [\text{H}_2\text{O}_2]$  now rearrange into the form of  $y = mx + b$

$\ln \text{rate} = a \ln [\text{I}^-] + [\ln k' + b \ln [\text{H}_2\text{O}_2]]$  (this equation is used for data sets 1,2, and 3 with  $[\text{I}^-]$  changing)  
 $y = m x + b$  (What does the value of m correspond to? \_\_\_\_\_)

$\ln \text{rate} = b \ln [\text{H}_2\text{O}_2] + [\ln k' + a \ln [\text{I}^-]]$  (this equation is used for data sets 3,4, and 5 with  $[\text{H}_2\text{O}_2]$  changing)  
 $y = m x + b$  (What does the value of m correspond to? \_\_\_\_\_)

### **Part 1 Trials: Do Not Record Your Data on This Sheet. Use Your Laboratory Notebook.**

Note: Be sure to use you use your data and the proper number of significant figures as dictated by the measuring device used, your data, and the calculations.

| Solution number | Buffer (mL) | 0.100 M KI (mL) | Starch (mL) | 0.0200M Na <sub>2</sub> S <sub>2</sub> O <sub>3</sub> (mL) | D.I. Water (mL) | 0.3 M H <sub>2</sub> O <sub>2</sub> (mL) | Blue Time (s) | Total Volume (mL) |

152LL Group Worksheet of Kinetics Part 1 Lab. Name: \_\_\_\_\_

Names: \_\_\_\_\_

1. How many moles of  $\text{S}_2\text{O}_3^{2-}$  are contained in 2.00 mL of 0.0200 M  $\text{Na}_2\text{S}_2\text{O}_3$ ?
2. How many moles  $\text{I}_2$  are required to completely react with the number of moles of  $\text{S}_2\text{O}_3^{2-}$  formed in **problem number 1**? The net ionic equation for the reaction is
$$2\text{S}_2\text{O}_3^{2-}(\text{aq}) + \text{I}_2(\text{aq}) \rightarrow 2\text{I}^-(\text{aq}) + \text{S}_4\text{O}_6^{2-}(\text{aq}).$$
3. The moles of  $\text{I}_2$  determined in **problem number 2** is equal to the number of moles formed in the chemical reaction:  $2\text{I}^-(\text{aq}) + \text{H}_2\text{O}_2(\text{aq}) + 2\text{H}^+(\text{aq}) \rightarrow \text{I}_2(\text{aq}) + 2\text{H}_2\text{O}(\text{l})$ . If the total volume of the solution was 16.00 mL, what was the concentration of the  $\text{I}_2$  in moles per liter (M)?
4. Suppose 3 different experimental runs with varying concentrations of initial reactants were conducted. The time for each run to reach the concentration of  $\text{I}_2$  determined in **problem number 3** was measured and recorded as follows: Run #1 8 minutes 45 seconds, Run #2 5 minutes 14 seconds, and Run #3 3 minutes 27 seconds. Determine the average rate of each experimental run in  $[\text{I}_2]/\text{s}$ .
5. A solution was prepared by taking 0.80 mL of 0.100 M KI and diluting it to a final volume of 16.00 mL. What was the resulting concentration of the  $\text{I}^-$  ion in units of M?
6. A solution was prepared by taking 2.40 mL of 0.30 M  $\text{H}_2\text{O}_2$  and diluting it to a final volume of 16.00 mL. What was the resulting concentration of the  $\text{H}_2\text{O}_2$  in units of M?
7. Now you will make Plots 1 and 2 to determine the order for each of the reactants and the rate law.
8. Once you have determined the orders you will use the rate law equation and each set of data to determine the value of the rate constant (k) for each run and then the average value of k. Be sure to include units for k values.
